## SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: Walter Briney Examiner #: 79993 Date: 3/2/04  
 Art Unit: 2644 Phone Number 305-0347 Serial Number: 101062, 686  
 Mail Box and Bldg/Room Location: 8D11 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

\*\*\*\*\*

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Optimization of DSL compatible POTS Linecard

Inventors (please provide full names): Nordin, Ronald A. (Lucent)  
Pasthuma, Carl R.

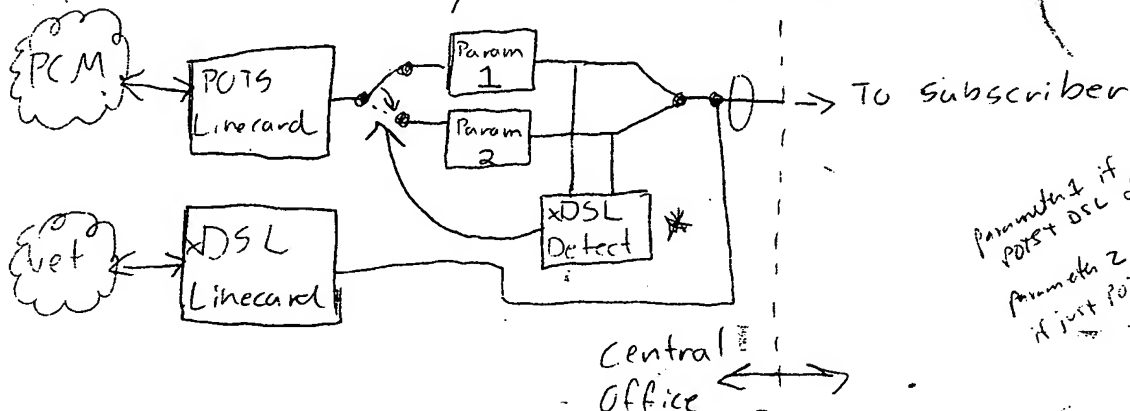

Earliest Priority Filing Date: 1/31/02

\*For Sequence Searches Only\* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Concepts:

◦ Detecting presence of xDSL signals on a subscriber loop.

◦ Vary function or parameters of a POTS linecard in presence of xDSL.

### Search Notes

Dear Walter Briney,

Please find attached the search results for 10/062686. I used the search strategy I emailed to you to edit, which you did. I searched the standard Dialog files, and the internet.

If you would like a re-focus please let me know.

Thank you.

Pamela Reynolds

...SPECIFICATION step 100.

In step 100, the user is notified in response to the earlier-taken  
**impedance measurements**. Specifically, from the preceding one skilled  
in the art will appreciate that step 100 may be reached either following  
step 94 in response to an **impedance measurement** indicating connection  
of RJ11 receptacle 62 to a low pass filter, or following step 98 in  
response to an **impedance measurement** indicating connection of RJ11  
receptacle 62 to either a low pass filter or to a...

...connection using those pins in RJ11 receptacle 62 along which the low  
pass filter was **detected**. Indeed, as DSL modems become more readily  
implemented in mobile computers, this option may prove very useful where  
...steps 92 and 98 are enhanced to specifically detect a POTS service  
rather than only **measuring impedance**. For example, the connections  
provided via switch 64 may be evaluated to determine if they...

Detailed Description

**English Abstract**

...modem start-up, the Off-Hook condition and other line problems are detected by direct **measurement** of the line **impedance**. Given a first **impedance measurement** in which the **impedance** is approximately equal to the impedance of the typical twisted-pair loop (124), the digital...

...that any Off-Hook equipment is protected with micro data filters. In response to this **detected** line condition, the **xDSL** communication is transmitted at the highest data rate supported by the transmission line.

**Detailed Description**

... pass filter that passes voice band but rejects an xDSL signal.

In response to this **detected** line condition, the **xDSL** communication is transmitted at the highest data rate supported by the transmission line. Given a second **impedance measurement**, in which the **measured impedance** is lower (e.g., 50%) than the line impedance of typical twisted pair loops, the...

...is used in order to avoid interfering with the Off-Hook equipment. Given a third **impedance measurement**, in which the **impedance** is significantly larger than the impedance of the typical twisted pair loops, the DSP of ...is received within a reasonable time period, the transmission will be terminated. Given a final **impedance measurement** in which the **impedance** is close to zero Ohms, the system of the present invention is able to detect...

Detailed Description

Claims

Detailed Description

... transmission of  
activation tones is a conventional DSL protocol.

The response detector 304 operates to **detect** the presence of **DSL** service on the **telephone line** to which the switching device 202 (FIG. 2) is switched. As discussed in more detail... transformer 204 and the telephone lines 106 and 108 according to the detection (or non- **detection** ) of **DSL** service on the current **telephone line** . As discussed above, the relay controller 306 (FIG. 3) controls the relay 402 over the...4 wherein the relay interconnects the line 108 and the transformer 204.

Next, the current **telephone line** , or the **telephone line** to which the relay is presently connected, is probed to **detect** the presence of **DSL** service pursuant to block 506. That is, the **telephone line** to which the relay 402 is currently switched is probed for DSL service. In one...

...to another pursuant to block 512, execution returns to block 506 wherein the new current **telephone line** is probed as discussed above. This method then continues until **DSL** service is **detected** pursuant to block 508 and the method ends at block 514 with the switching device...been switched pursuant to block 712, execution returns to block 706 wherein the new current **telephone line** is probed as discussed above.

This method then continues until **DSL** service is **detected** pursuant to block 708.

If DSL service is detected pursuant to block 708, then execution...

#### Claim

... selectively  
switching connection between the each of the telephone lines and the data processor until **detecting** **DSL** service on either the first **telephone line** or the second **telephone line** .

2 The DSL modem according to claim 1, wherein the switching device further comprises at...

...2, wherein the switching device further comprises at least one mechanical relay for connecting the **telephone line** **detected** as having **DSL** service thereon to the data processor.

4 The DSL modem according to claim 1, wherein...

...first and second telephone lines.

17  
line to the second line; and  
probing the second **telephone line** to **detect** the availability of **DSL** service on the second **telephone line** if no **DSL** service is **detected** on the first **telephone line** .

7 The method according to claim 6, further comprising repeating the probing the first **telephone line** and the probing the second **telephone line** until **DSL** service is **detected** on

either the first telephone line or the second telephone line .

8 The method according to claim 6, wherein the probing the first telephone line and...DSL modem means coupled to first and second telephone lines;

means for probing the first telephone line to detect the availability of DSL service on the first telephone line ;

means for probing the second telephone line to detect the availability of DSL service on the second telephone line if no DSL service is detected on the first telephone line .

16 The device for identifying which of a plurality of telephone lines has DSL service...

Line card and method for supporting POTS , asymmetric DSL and symmetric  
DSL services

Leitungskarte und Verfahren zur Unterstutzung von POTS , asymmetrischen  
und symmetrischen DSL Diensten

Carte de ligne et methode de support de POTS , des services DSL  
asymmetriques et symmetriques

...ABSTRACT method is provided which supports symmetric and asymmetric  
telecommunication services, such as symmetric and asymmetric DSL  
services. The line card may support concomitantly POTS and asymmetric  
DSL services or support DSL services. A xDSL interface provides  
processing for DSL signals and a POTS interface provides processing  
for POTS signals. The line card is capable of switching operating modes  
or which services-it is...

...SPECIFICATION data and voice communications and, in particular, to a  
line card and method which supports POTS and asymmetric DSL and which  
supports DSL .

There is an ever pressing need for telecommunication service providers  
to provide cheaper, faster and...

...equal, the service is termed "asymmetric".

Line cards, for example, supporting symmetric applications for such **xDSL**, technologies as HDSL2 and SDSL have not supported concurrent operation with **POTS**. Line cards are known which provide concurrent asymmetric **xDSL** services, such as ADSL or ADSL Lite, and **POTS**. Unfortunately, those line cards do not support symmetric **xDSL** services. Hence, different circuit packs, or line cards, are needed in the telecommunications systems for the various symmetric and asymmetric services and **POTS**.

Accordingly, there is thus a need in the art for a line card and method for supporting concomitant operation of **POTS** and asymmetric **digital subscriber line** services and for supporting symmetric and asymmetric **digital subscriber line** services.

#### SUMMARY OF THE INVENTION

This need is met by a line card and method in accordance with the present invention which substantially concomitantly supports **POTS** and asymmetric **digital subscriber line** services and is also capable of supporting symmetric and asymmetric **digital subscriber line** services. The line card includes a controller which controls the card's operation to support...

...comprises a multiple mode circuit capable of supporting symmetric and asymmetric telecommunication services, such as **xDSL** services. The line card may include a **POTS** interface for supporting **POTS** service. Preferably, the line card substantially concomitantly supports **POTS** service and asymmetric **xDSL** services. The line card may comprise a **xDSL** interface for supporting symmetric and asymmetric **xDSL** telecommunication services. Preferably, the **xDSL** interface is capable of supporting any one of ADSL, ADSL lite, VDSL, HDSL, SDSL, HDSL2...

...card is provided which includes a multiple mode circuit capable of supporting **POTS** service, symmetric **digital subscriber line** services and asymmetric **digital subscriber line** services. Preferably, the multiple mode circuit is capable of supporting the **POTS** service substantially concomitant with at least one of the **digital subscriber line** services.

In accordance with yet another aspect of the present invention, a method for supporting **POTS** and asymmetric **digital subscriber line** services and for supporting symmetric and asymmetric **digital subscriber line** services on a line card is provided. The method comprising the steps of: selecting whether to support the **POTS** and asymmetric **digital subscriber line** services or whether to support the **digital subscriber line** services; receiving a communication signal at the line card; if **POTS** and asymmetric **digital subscriber line** services are being supported, separate **POTS** signals and asymmetric **digital subscriber line** signals in the communication signal; process the **POTS** and asymmetric **digital subscriber line** signals; if symmetric and asymmetric **digital subscriber line** services are being supported, separate **digital subscriber line** signals in the communication signal; and process the **digital subscriber line** signals.

These and other features and advantages of the present invention will become apparent from...

...SPECIFICATION the customer premise to integrate voice service over the  
data service.

One issue that each DSL service provider must face is how the  
customer premise integrated access device is to be powered. In POTS  
telephony, 48 volts DC is supplied from the central office for most  
functions, and approximately...

...the central office for ringing. The integrated access device must supply  
these voltages to all POTS telephones to which it is connected; as well  
as supply power to the other components (interfaces, routers, etc., as  
will be discussed further, below, in connection with FIG. 2). Some DSL  
standards specify that power is delivered from the central office in a  
similar manner as POTS service. However, the integrated access device  
requires power at all times, and requires more power than a POTS  
telephone. Thus, central power delivery is a very expensive proposition  
for the operating company. Hence...in an operating switching office  
depending on the particular implementation.

In this exemplary embodiment, each DSL terminal unit 28 interface 32.  
is connected by a tip-ring pair 48 to an...

...62, such as a personal computer, workstation or other data devices, and a plurality of POTS telephones 64, 65, 66, 67 and 68 and ISDN telephone 69. In order to provide...

**A DSL-compatible line card for analog telephone lines**

**...ABSTRACT A2**

An improved plain old telephone service ( POTS ) line card (238) may be directly connected to a customer line that is also connected to a digital subscriber line access module. A second order filter (246) is added to the front end of the POTS line card in order to attenuate XDSL signals and to lower its amplitude. A new digital signal processor (240) (DSP) includes further...

...balance network compensation (252) to provide the proper balanced network as is known in current POTS cards but not provided in current XDSL services. This card may also be used alone, without a XDSL equipped line.

...SPECIFICATION new technology that can be implemented over the embedded copper networks is digital subscriber line ( DSL ). DSL comes in many varieties such as asymmetrical DSL (ADSL) (upstream and downstream have different bandwidth requirements) and other varieties of service (herein XDSL ). Many XDSL technologies provide high speed data service over current tip-ring pairs by encoding the signals in frequency ranges above the POTS frequency. Thus, one tip-ring pair can provide both POTS service and high-speed data service.

The local service providers (who are no longer part...

...universal Bell System), however, have to make major changes in their central office to provide XDSL service. FIG. 1 is a block diagram of a current central office providing XDSL service. Central office 10 includes a local telephone switching system (switch) 12 that provides the usual POTS telephone services and features. In order to provide XDSL , central office 10 also includes digital subscriber line access multiplexer (DSLAM) 14 which sends and receives digital signals to and from the subscribers...

...SPECIFICATION support line termination equipment;

FIG. 2 is a graphical representation of a system for providing POTS and XDSL services in accordance with an aspect of the present invention; and

FIG. 3 is a block diagram of another aspect of the present invention for providing POTS and XDSL services.

#### DETAILED DESCRIPTION

One or more specific versions of the present invention will be described...

...a single subscriber line supports at least two different classes of subscriber service, such as POTS and XDSL or other high speed data services. The "X" in XDSL represents one of a family of digital subscriber line services such as ADSL ( asymmetric ), ADSL Lite, RDSL (rate-adaptive) and VDSL (very high speed...

...a signaling method to provide higher data transmission speeds than can be supported by conventional POTS line transmitting equipment. "X" could also be used in energy mode for SDSL, HDSL, HDSL II and SHDSL where POTS circuitry would not be present.

Now, referring to FIG. 2, consumer premises equipment (CPE) 135...

...such as a telephone) which can be connected to the subscriber line 134 via a POTS splitter 138 to receive POTS signals. The subscriber may elect to couple a high speed data interface (an interface circuit), such as a XDSL interface 140, via a POTS splitter 138 to the subscriber line 134 to support high speed data communications. A high speed data device, shown as a personal computer 142, is illustratively shown connected to the XDSL interface 140. For purposes of this disclosure, a data device may comprise the personal computer 142 and the XDSL interface 140. It will be appreciated, however, by those skilled in the art that high...

...signal information.

The BAIU 144 comprises a plurality of components such as a plurality of:

**Title: For DSL , closer is faster**

Abstract: A Digital Subscriber Line ( DSL ) delivers high-speed Internet access using existing copper telephone lines already installed in millions of homes and businesses worldwide. DSL promises to provide broadband speeds of up to 8 Mbps, which is up to 50 times faster than conventional dial-up connections. In reality, however, the true speeds attainable by DSL are not quite as staggering. Tests carried out in the Republic of Ireland have shown that there are a number of factors that play a role in determining the speed of access available under DSL technology to the subscriber. Using comprehensive test results and expert knowledge of the local loop make-up, it is shown that the high speed access with DSL as claimed by many service providers is, in fact, not a reality. However, it can...

Title: Loop makeup identification via single ended testing: beyond mere  
loop qualification

Abstract: Digital subscriber lines (DSLs) offer carriers the  
possibility of exploiting the existing loop plant to deliver high-speed  
data and voice services. However, before deploying DSL , local loops must  
be tested in order to see whether they can support service, and...

... what level. In fact, there are many impairments that could disqualify a loop for supporting DSL services: load coils, excessive loop length, bridged taps, and wideband noise. Single-ended automatic qualification is essential for achieving low-cost deployment of DSL, since it allows loops to be qualified in bulk and does not involve any human intervention at the customer's location. An even more ambitious challenge is to fully characterize a loop, i.e., to identify its loop makeup. If it is feasible to perform loop makeup identification via single-ended measurements with sufficient accuracy, then operators will benefit substantially because, besides qualifying a loop for DSL service, this capability will allow the updating of telephone company loop-records. These records can...

... engineering, provisioning and maintenance operations. Despite its potential importance, the possibility of achieving loop makeup identification via single-ended measurements is not widely addressed in the current literature. In the present contribution the feasibility of loop makeup identification via single-ended measurements is presented.

**Title: Crosstalk identification in xDSL systems**  
 Abstract: Crosstalk among **telephone lines** in the same or neighboring bundles is a major impairment in current xDSL systems. This paper proposes a novel idea of an impartial third party that **identifies** the crosstalk coupling functions among the twisted pairs in these xDSL systems. The crosstalk **identification** technique includes the following four major procedures: (1) the transmitted and received signals from each **DSL** modem for a predefined time period are collected and sent to the third party; (2

... squares method. The performance of the cross correlation and least-squares methods is analyzed to **determine** the amount of data needed for **identification**. Simulation results show that the proposed methods can **identify** the crosstalk functions accurately and are consistent with theoretical analysis. These **identified** crosstalk functions can be used to significantly improve the data rate (e.g., multiuser **detection**) and to facilitate provisioning, maintenance, and diagnosis of the xDSL systems.

**Title:** DSL : the promising standard for new Internet era

**Abstract:** DSL ( Digital Subscriber Line ) is the technology that enables high-speed data transfer and rapid access to the Internet via telephone lines , with a secure connection straight into the high-speed network. DSL has raised its importance in the data communication industry. This article identifies the importance of DSL in Internet age, illustrates DSL 's analysis and development frameworks, and delineates future development of the DSL technology.

Abstract: The current asymmetrical digital subscriber line (ADSL) standard, or T1.413 issue 2/G.DMT, incorporates a plain - old telephone system ( POTS ) splitter in both the remote terminal and the central office to separate the voiceband from the DSL spectrum. Thus, ADSL deployment to residential customers usually requires professional installation of a splitter. The emerging splitterless ADSL standard, commonly known as G.Lite, eliminates the need for a POTS splitter and allows rapid mass deployment of DSL technology. However, approximately 80% of homes in a recent field trial of G.Lite required...

... each phone computer modem, fax, and answering machine to eliminate potential noise or interference between POTS devices and the ADSL modem is necessary in most cases. These microfilters are, in essence, distributed splitters; they move the filtering function from outside the house to locations inside the house at which the end user can perform the installation.

**Title: DSL top 10 [splitterless DSL]**

Abstract: Interest in high-speed access over **digital subscriber lines** is high. Announcements of splitterless technologies as well as an initiative by Compaq, Intel and Microsoft to develop a universal asymmetrical **DSL** splitterless standard, have increased this interest. It is important to understand the breadth and depth of issues that have contributed to the delay in widescale **DSL** deployment. **DSL** 's ability to operate over the same copper wire that provides basic service is essential  
...

...data service from the telephone service at the customer premises and the network service provider location . Emerging splitterless solutions will allow POTS and DSL data service to extend directly into the customer premises over existing intrabuilding telephone wire.

**Title: A CMOS activity detector for ADSL link**

Abstract: A CMOS activity detector , integrated into a CMOS 0.7  $\mu$ m analog front-end, is used to reduce the sleep mode power dissipation of an ADSL link (asymmetric digital subscriber line ). A dynamic analog sensor using correlated double sampling produces high sensitivity of 1.5 mVpp, with more than 20 dB DC and POTS ( plain old telephone signal) signals rejection. In sleep mode, only the activity detector has to be powered, consuming 6.2 mW, compared to the 5-6 W required...

**Title: Profile detection in multiuser digital subscriber line systems**

**Abstract:** Multiuser transmission methods for digital subscriber line (DSL) systems have become of interest with the potential for increased data rate and loop reach...

...of crosstalk interferers, called the crosstalk profile, and their associated channel responses are known. For DSL systems, the interferers are often uncoordinated, so that in a dynamic environment where DSL transmitters can energize and deenergize, the crosstalk profile cannot be transmitted to the user of...

...intractable for general transmission systems, channel and crosstalk analysis can make use of the specific DSL environment. Namely, the physical channels in a DSL system do not change rapidly, and hence estimates of the crosstalk channel can be saved...

...this reason, we introduce the concept of a channel profile. We develop several algorithms to detect the crosstalk profile and investigate the asymptotic behavior of the new algorithms. Simulations show that for typical crosstalk interference scenarios, the observation time to determine the correct crosstalk profile at probability of error less than  $10^{-3}$  can be less...

**Title:** Crosstalk identification in xDSL systems  
**Abstract:** Crosstalk among telephone lines in the same or neighboring  
bundles is a major impairment in current xDSL systems. This paper proposes  
a novel idea of an impartial third party that identifies the crosstalk  
coupling functions among the twisted pairs in these xDSL Systems. The  
crosstalk identification technique includes the following four major  
procedures: 1) the transmitted and received signals from each DSL modem  
for a predefined time period are collected and sent to the third party; 2  
...  
...squares method. The performance of the cross correlation and  
least-squares methods is analyzed to determine the amount of data needed  
for identification. Simulation results show that the proposed methods  
can identify the crosstalk functions accurately and are consistent with  
theoretical analysis. These identified crosstalk functions can be used  
to significantly improve the data rate (e.g., multiuser detection) and  
to facilitate provisioning, maintenance, and diagnosis of the xDSL  
systems. 14 Refs.

**The DSL connection -- DSL is hot - or it's not**

Kennard, Linda

NetWare Connection , August 1, 2000 , v11 n8 p6-14, 5 Page(s)

ISSN: 1076-3422

**The DSL connection -- DSL is hot - or it's not**

Presents a guide to broadband Internet access via **digital subscriber line (DSL)**. Points out that the geographical location of a customer's home or office influences the availability, potential speed, and cost of **DSL**. Enumerates seven flavors of **DSL**, each of which is designed to serve a different purpose and consequently offers a different data transmission rate. Defines Asymmetric **DSL (ADSL)**. Cites G.lite **ADSL**. Talks about Rate Adaptive **DSL (RADSL)**. Mentions the very-high-bit-rate **DSL (VDSL)**. Highlights the high-bit-rate **DSL (HDSL)**. Explains **HDSL-2**. Showcases the integrated services digital network **DSL (IDSL)**. Displays a table comparing **HDSL**, **HDSL2**, **G.lite**, **ADSL**, **RADSL**, **VDSL**, and **IDSL** on upstream rate, downstream rate, distance limitations, and requirement for **plain old telephone service (POTS)**. Includes a sidebar, a photo, a table, and a diagram. (MEM)

**DSL deployment barrier falls amid consolidation; share lines, FCC orders carriers**

Salamone, Salvatore

InternetWeek , November 29, 1999 , n791 p8, 1 Page(s)

ISSN: 0746-8121

**DSL deployment barrier falls amid consolidation; share lines, FCC orders carriers**

Reports that the United States Federal Communications Commission released a line-sharing ruling that allows **digital subscriber line (DSL)** providers and competitive local exchange carriers (CLECs) to deliver **DSL** service over the same line as regular **telephone** service. Notes the decision is being hailed by service providers as a way to simplify their delivery of **DSL**. Says that the ruling will lower the monthly cost of **DSL** service, which currently starts at \$50 per month, by up to \$20 and cut in half the typical three to six weeks needed for **DSL** installation. Explains that line-sharing will enable service providers to test the line on the spot to **determine** if it will support **DSL**. Mentions the possibility that new service offerings could be developed as a result of the...

Hot carrier gear sparks new breed of services -- Voice over DSL , DSL  
.Lite around the corner

Greene, Tim

Network World , June 7, 1999 , v16 n23 p1, 88, 2 Page(s)

ISSN: 0887-7661

Hot carrier gear sparks new breed of services -- Voice over DSL , DSL  
.Lite around the corner

Discusses trends in digital subscriber line ( DSL ), optical networking, and voice/data convergence technologies. Predicts that products in these markets will be...

... come from both established and new companies. Indicates each technology's capabilities; namely, Voice-over- DSL 's ability to support 16 voice connections over a single telephone line , DSL .Lite's ability to download at 1.5Mbps via modem, Passive optical networking's (PON's) ability to deliver 100Mbps fiber connections to users' homes. Reports that two voice-over- DSL vendors, CopperCom and Jetstream, are working to make their equipment compatible with other equipment located at customers' sites and carriers' switching offices. Adds that BellSouth is introducing a PON solution...

Speedy 'net lines roll out slowly -- Carriers creep up on digital  
subscriber line

Girard, Kim

Computerworld , May 19, 1997 , v31 n20 p45-48, 2 Page(s)

ISSN: 0010-4841

Speedy 'net lines roll out slowly -- Carriers creep up on digital  
subscriber line

Reports that digital subscriber line ( DSL ) technology will take twice as long as expected to achieve market acceptance due to clashing...

... uncertainty over how to price and market the technology. Explains that potential users cannot have DSL access because they are located more than 18,000 feet from the carriers central office or have telephone line problems. States that DSL provides megabit speeds over regular telephone lines and enables carriers to offload data traffic from overloaded switches. Adds that most carriers are still testing the technology. Notes the development of hybrid ISDN and DSL , called IDSL, which can reach speeds of 768K bit/sec and that UUnet Technologies Inc...

**Data transmission capacity estimation system for digital subscriber line local loop, uses real portion of measured input impedance of local loop to estimate capacity**

Abstract (Basic):

... Each entry in a table contains a potential value of input **impedance** and a corresponding data transmission capacity value. A computer (712) estimates the data transmission capacity value of the **DSL** local loop from the table entries using the real portion of the **measured** input **impedance** of the local loop.

... 4) Method for **determining** whether subscriber loop supports broadband service...

...For **determining** the data transmission capacity of a **digital subscriber line (DSL)** local loop in **plain old telephone system (POTS)**.

...can be estimated easily, rapidly and efficiently by using the real portion of the input **impedance** of **DSL** loop

...Title Terms: **MEASURE** ;

**Network modeling method for measuring crosstalk in xDSL networks by  
first determining topology based on model and measured loop parameters**

Abstract (Basic):

... Involves measuring loop parameters of a transmission line and determining the topology of the transmission line by analysing the measured parameters. The analysis is carried out with reference to a particular model selected from several models for transmission lines of different topologies. A further model is selected to estimate crosstalk related parameters based on the determined topology.

... For measuring crosstalk in xDSL networks...

...The drawing shows a block diagram of the system used to implement the method...

Communication reconfiguration information sharing for asymmetrical digital subscriber line communication system, involves receiving ack/comply signal for reconfiguration transceive parameters implementation based on timing information

Abstract (Basic):

... The reconfiguration transceive parameters indicating reconfiguration of a data communication channel and ack/comply timing information indicating at which an ack/comply is expected, are determined and transmitted over an OAM channel (430). A physical media dependent ack/comply signal indicating whether reconfiguration transceive parameters to be implemented, is received based on the ack/comply timing information.

... For sharing communication reconfiguration information in asymmetrical digital subscriber line (ADSL) communication system and other bidirectional communication system such as cable modem or wireless system...

...As the signal for reconfiguration transceive parameters implementation is received based on ack/comply timing information, the

receiver efficiently tailor the allowed for...

Comfort noise generating method, for improving voice signals transmitted  
over DSL or IP networks, includes using an algorithm that adapts with  
time when silence segment is detected

Abstract (Basic):

... If near-end speech activity is detected (112) in input data  
(110), encoding occurs (114) and codeword data is sent (116) to a  
channel to be transmitted to a decoder. If near-end speech activity is  
not detected, comfort noise generator adaptation occurs (118) using  
an algorithm to approximate the spectrum of an input noise using a  
least mean square (LMS) function and, after filter parameter encoding  
(120), silence insertion descriptors (SID) are sent to the channel.  
... An INDEPENDENT CLAIM is also included for a comfort noise  
generating system including an identifier for identifying silence  
packets in speech data, an adaptation algorithm that adapts with time,  
and a detector for determining a start of a silence segment. A  
comfort noise generator generates comfort noise by the...

...The comfort noise generating method is used for improving voice signals transmitted over **digital subscriber lines** or via internet protocol networks...

...The figure shows a flowchart illustrating an encoder **implementing** a comfort noise generating method...

A digital subscriber line communications method for high speed data transmission over various networks comprises continuously monitoring a channel...

Abstract (Basic):

... A communications channel is continuously monitored (410) to determine the real-time bandwidth allocation and symmetry requirements between a subscriber and service provider. If a parameter change request is received (420), the bandwidth allocation and/or symmetry are dynamically adjusted (440). If no change request is received the channel is continuously monitored to detect a change in requirements across the channel (430) and these adjustments are made.

... a) a digital subscriber line (DSL) transceiver...

...c) and a machine-readable medium having stored instructions to implement a DSL communications method...

...The digital subscriber line communications method is used for high speed data transmission over various networks...

...Both symmetric and asymmetric high speed DSL applications are satisfied across the same communications channel...

Integrated plain old telephone system and digital subscriber loop

line card has high pass filter coupled with impedance generator, to filter detected low frequency transients in plain old telephone system receive path

Abstract (Basic):

... An impedance generator (80) coupled between a plain old telephone system ( POTS ) receive path (402) and a combined POTS /digital subscriber loop ( DSL ) transmit path (401), synthesizes impedance for signals in the combined POTS / DSL transmit path. A high pass filter (13) coupled with impedance generator, filters low frequency transients detected by a low frequency signal detector (70) in the POTS receive path.  
... An INDEPENDENT CLAIM is also included for method of suppressing low frequency transients in combined POTS / DSL line card .  
...

...Integrated plain old telephone system ( POTS ) and digital subscriber loop ( DSL ) line card in telephone network...

...Ensures realizing integrated POTS / DSL line card capable of suppressing low frequency transients. Prevents incorrect loop termination and signal degradation, thereby avoiding data loss of DSL service...

...The figure shows a block diagram of the integrated POTS / DSL line card .  
...

...low frequency signal detector (70...

...combined POTS / DSL transmit path (401...

... POTS receive path (402

**Measurement of line attenuation especially for use in determining the  
suitability of telephone lines for carrying ADSL signals, where  
testing can be carried out by a single technician**

Abstract (Basic):

... c) **determination** of the signal amplitude at the same frequency  
...

...d) **determination** of the signal attenuation from the ratio of the two  
amplitudes.

... INDEPENDENT CLAIMS are made for a device and an electronic **card**  
for measuring line attenuation at a given frequency. The invention  
also concerns a measurement test and diagnostic unit used with the  
electronic **card** .  
...

...The invention is for rating asymmetric **digital subscriber lines** .  
...

...suitable for ADSL are classed as such, so physical measurement is  
necessary to more accurately **determine** which lines are suitable.

Current methods employ two technicians, one at each end of a...

Automatically determining high speed service capability of subscriber line for e.g. XDSL, HDSL and ADSL services

Inventor: POSTHUMA C R

Abstract (Basic):

... For packet data services provided over conventional switched telephone lines e.g. XDSL, ADSL and HDSL digital subscriber line systems...

...International Patent Class (Main): H04M-001/24 ...

... H04M-003/22  
...International Patent Class (Additional): H04M-003/00 ...  
... H04M-003/08 ...

Loop telephone line assemblies for digital subscriber line DSL  
services and plain old telephone service POTS uses long loop  
telephone hybrid lines  
Inventor: POSTHUMA C R

Abstract (Basic):

... long loop telephone line are used to provide uniform  
response for voice communication in order to extend the frequency...  
... An INDEPENDENT CLAIM is also included for method of enabling  
DSL service on a long plain old twisted pair loop...

... Digital subscriber line DSL and plain old telephone  
service POTS .

Allocating overhead voltage method in response to communication state of public old telephone services ( POTS ) and digital subscriber line services ( XDSL ) signals using line drivers controlled by processor

Inventor: POSTHUMA C R

Abstract (Basic):

... The processor (135) determines the voltages needs of the line driver (125) depending on the POTS state, XDSL state and loop conditions of the system (100), using the detection circuitry of the telephonic...

... For transmission of POTS and XDSL signals in a communication system...

...The maximum data rates are used for XDSL signals and high voice quality is achieved for POTS signals...
